Project Name	Incident Lifecycle Automation in ServiceNow	**Maximum Marks**	4 Marks

Brainstorming & Prioritization Approach

Brainstorming encourages team members to generate and refine possible solutions before selecting the most useful ideas. The ideas below are grouped by their role in the incident lifecycle and prioritized by expected operational value.

This document applies brainstorming and idea prioritization to a ServiceNow incident-management solution. It focuses on capturing incidents consistently, classifying and prioritizing them, routing work to the right support team, monitoring service-level targets, escalating delays, and documenting resolution.

Step 1 – Team Gathering, Collaboration and Problem Statement

Project Overview

Incident Lifecycle Automation in ServiceNow

In many organizations, IT issues can arrive through different channels and may lack consistent classification, ownership, or status visibility. This can delay investigation, make escalation harder, and reduce visibility into response and resolution performance.

Selected Problem Statement

Organizations need a structured incident-management workflow in ServiceNow that records reported IT issues, classifies them consistently, calculates priority from impact and urgency, assigns them to an appropriate support group, monitors response and resolution targets, escalates overdue work, and tracks incidents through closure.

Step 2 – Brainstorm, Idea Listing and Grouping

Idea / Area	Proposed Solution
Incident Intake	Create a consistent incident record from a user-reported IT issue, with required details and a clear summary.
Classification	Use category, subcategory, service, and configuration-item details to organize incidents consistently.
Priority Calculation	Use impact and urgency to determine incident priority and help teams handle critical issues first.
Assignment Routing	Route incidents to the appropriate assignment group using classification and service information.
Technician Ownership	Support clear ownership by assigning an incident to an available technician within the responsible group.
SLA Monitoring	Track response and resolution targets and identify incidents that are approaching a breach.

Escalation	Escalate incidents when defined time thresholds or priority conditions require additional attention.
Notifications	Notify relevant users, agents, and managers about assignment, status changes, escalations, and resolution.
Activity & Work Notes	Maintain troubleshooting notes and an activity history to support collaboration and traceability.
Resolution & Closure	Capture resolution details and apply closure checks so completed incidents are documented properly.

Step 3 – Idea Prioritization

Priority	Idea	Reason for Priority	Expected Benefit
1 – High	Classification & priority calculation	Consistent classification and prioritization guide the rest of the workflow.	Faster, more consistent handling of important incidents.
2 – High	Assignment routing	Correct routing reduces time spent finding the responsible support team.	Quicker ownership and reduced routing delays.
3 – High	SLA monitoring & escalation	Time-based monitoring helps teams notice delays and act before or after a breach.	Improved response visibility and escalation discipline.
4 – Medium	Notifications	Updates keep affected users and support staff informed.	Clearer communication and fewer status enquiries.
5 – Medium	Activity history & work notes	A shared record helps the team understand actions already taken.	Better collaboration and traceability.
6 – Medium	Resolution & closure checks	Documented resolution information improves the quality of closed records.	More reliable reporting and lifecycle control.

Proposed Automated Incident Lifecycle

Incident reported → Incident record created → Classification → Impact/urgency assessment → Priority calculated → Assignment group selected → Technician assigned → Investigation and work notes → SLA monitoring → Escalation/notifications when needed → Resolution documented → Incident closed

Expected Outcome

The proposed solution provides a structured view of an incident from intake to closure. The prioritized ideas aim to reduce manual routing, make priority decisions more consistent, improve visibility of response and resolution targets, support timely escalation, and preserve useful incident history. These are proposed capabilities; actual behaviour depends on the ServiceNow configuration and implementation.

Reference

Brainstorming and idea prioritization structure adapted for the Incident Lifecycle Automation in ServiceNow project. The Metro Ticket project is not part of this document.
