PROJECT DESIGN PHASE

Solution Architecture

Date	04 September 2026	Team ID	_____
Project Name	Incident Lifecycle Automation in ServiceNow	Maximum Marks	4 Marks

Solution Architecture

The proposed architecture bridges the incident-management business problem and the ServiceNow technology solution. It defines the structure, behavior, workflow, integrations, and delivery requirements needed to automate the complete Incident Management lifecycle.

Architecture Goals

• Find a suitable technology solution for structured incident handling and faster resolution.

• Describe the structure, characteristics, and behavior of the ServiceNow Incident workflow for project stakeholders.

• Define features and requirements for creation, classification, assignment, investigation, resolution, change handling, child incidents, and knowledge reuse.

• Provide specifications for managing incidents, SLAs, escalations, and service visibility.

Proposed Architecture and Incident Data Flow

1. Incident Intake	Service Desk creates the incident and captures required details.
2. Incident Management	Classification and prioritization establish the correct handling path.
3. Assignment & SLA	Incidents are routed to the appropriate support group with SLA tracking and escalation.
4. L2 Support	Level 2 technicians investigate, document work, and resolve the incident.
5. Connected Capabilities	Knowledge Management supports faster resolution; emergency change requests and child incidents are created when required.
6. Knowledge & Reporting	Resolved incidents can generate reusable knowledge, while status and SLA reporting improve service visibility.

Figure 1. Proposed ServiceNow architecture and incident data flow

Architecture Components & Flow

1. Incident Intake: Service Desk creates the incident and captures required details.

2. Incident Management: Classification and prioritization establish the correct handling path.

3. Assignment & SLA: Incidents are routed to the appropriate support group with SLA tracking and escalation.

4. L2 Support: Level 2 technicians investigate, document work, and resolve the incident.

5. Connected Capabilities: Knowledge Management supports faster resolution; emergency change requests and child incidents are created when required.

6. Knowledge & Reporting: Resolved incidents can generate reusable knowledge, while status and SLA reporting improve service visibility.

Expected Operational Support

• A consistent path from incident intake through investigation and resolution.

• Assignment, escalation, and SLA tracking to improve service visibility.

• Connections to Knowledge Management, emergency change requests, and child incidents when required.

• Knowledge reuse and status/SLA reporting to support continuous improvement.
